

System Recovery Agent for IBM Storage Protect (TBMR)

Turn IBM Storage Protect backups into complete, recoverable systems

Data Sheet

IBM Storage Protect secures your data. TBMR recovers the system.

Recover complete Windows, Linux and AIX systems directly from IBM Storage Protect backups, whether you need straightforward bare machine recovery or automated, enterprise-scale recovery orchestration. Recovery can be performed to suitable physical, virtual and cloud targets.

IBM Storage Protect provides resilient protection for your critical data. Cristie System Recovery Agent for IBM Storage Protect (TBMR) extends that protection to the entire system, enabling organisations to recover operating systems, applications, configuration and data without rebuilding servers from scratch.

How it works - Two deployment models. One recovery technology.

Deploy **TBMR as a standalone agent** for fast, flexible system recovery, or combine it with **Cristie Recovery Hub** to centralise, automate and orchestrate recovery across larger and more complex environments.

● TBMR Standalone Agent

Simple, flexible bare machine recovery when you need it. For organisations that need reliable system-level recovery without additional recovery infrastructure, TBMR can be deployed directly to protected systems as a lightweight agent.

● TBMR with Cristie Recovery Hub

Transform individual system recovery into automated enterprise recovery at scale. As environments grow, recovery must scale beyond individual systems. Recovery Hub allows IT teams to orchestrate system recovery at scale, reduce manual intervention and gain central visibility across the entire recovery process.

System Recovery: TBMR Standalone Agent

Semi-automated, multi-step process.

System Recovery: TBMR + Cristie Recovery Hub

Automated process with orchestrated recovery.

Benefits - TBMR Standalone Agent

TBMR when used as a standalone agent records the information required to reconstruct each protected machine and uses the data already held within IBM Storage Protect to recover the complete system. Dedicated bootable recovery environments allow recovery to proceed even when the original operating system is unavailable.

The result is a practical, cost-effective way to extend IBM Storage Protect from data protection to complete system recovery.

- Recover more than just your data
- Recover to alternative infrastructure
- Maximise your IBM Storage Protect investment
- Support heterogeneous environments

Benefits - TBMR with Cristie Recovery Hub

Cristie Recovery Hub builds on TBMR by adding the centralised management, automation and orchestration needed to operationalise recovery across the enterprise.

By enabling **Continuous Recovery Assurance**, Recovery Hub can automatically test and validate protected systems as part of an automated recovery assurance process.

Verification takes place in an isolated **Cleanroom Recovery** environment providing the option to safely validate recoveries for indicators of compromise before production recovery.

- Easily perform recovery at scale
- Centralise recovery operations
- Boost cyber resilience with Cleanroom Recovery
- Reduce manual intervention
- Standardise recovery processes
- Gain recovery confidence with Continuous Recovery Assurance

Platform, OS & Cloud Support

OS Support - Complete system recovery for Windows, Linux and AIX, with recovery to dissimilar hardware and infrastructure.

Physical, Virtual & Cloud - Recover IBM Storage Protect-protected systems across physical, virtual and supported cloud environments, with Recovery Hub adding automated provisioning with centralised cross-platform orchestration.

Platforms - Support is provided for a range of enterprise server architectures, including x86, IBM Power and Oracle SPARC.

Cloud & Container Orchestration - Recovery is supported to and from a wide range of cloud, virtualisation and container platforms, including Microsoft Azure, Hyper-V, Oracle Cloud, AWS, Kubernetes and VMware.

Built for Evolving Infrastructure - Cristie continues to extend its recovery architecture for emerging platforms and modern workloads, including greater cloud, hypervisor and container recovery capabilities.

Key Features

	TBMR Standalone Agent	TBMR + Cristie Recovery Hub
Typical Application:	Individual and targeted system recovery	Enterprise and large-scale recovery
System recovery	✓	✓
Native IBM Storage Protect backup recovery	✓	✓
Windows, Linux & AIX	✓	✓
Dissimilar hardware recovery	✓	✓
Guided recovery	✓	✓
Bootable Recovery Environments	✓	✓
Automated Driver Injection	✓	✓
Flexible Disk & Storage Mapping	✓	✓
Post-Recovery Network Configuration	✓	✓
Multi-Factor Authentication Support	✓	✓
Automated Configuration Capture	✓	✓
Recovery Logging & Diagnostics	✓	✓
Centralised management		✓
Recovery orchestration		✓
Multi-system recovery at scale		✓
Automated recovery workflows		✓
Continuous recovery assurance		✓
Cleanroom Recovery		✓

Summary

Backup is only valuable when you can recover. IBM Storage Protect protects the data your organisation depends on; Cristie TBMR helps turn that protected data back into working systems. Start with standalone TBMR to give individual workloads complete system recovery; add Recovery Hub when your requirements expand to centralised management, automation and recovery at enterprise scale. Together, IBM Storage Protect + Cristie provide a recovery strategy that goes beyond restoring files and data, helping organisations get critical systems and business services running again.

TBMR Standalone Agent when you need simplicity. Cristie Recovery Hub when you need scale.
